

# Soil & Groundwater Remediation

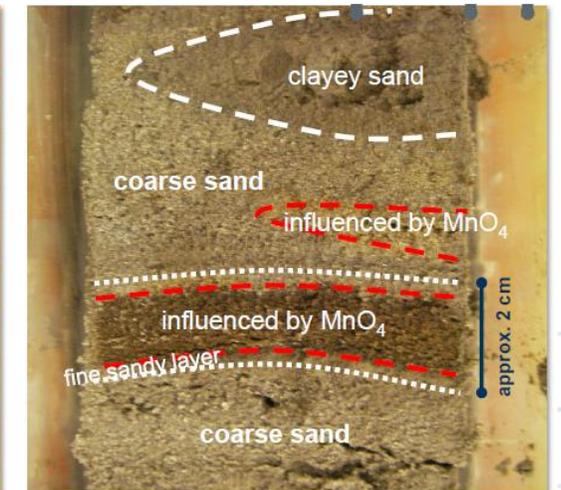

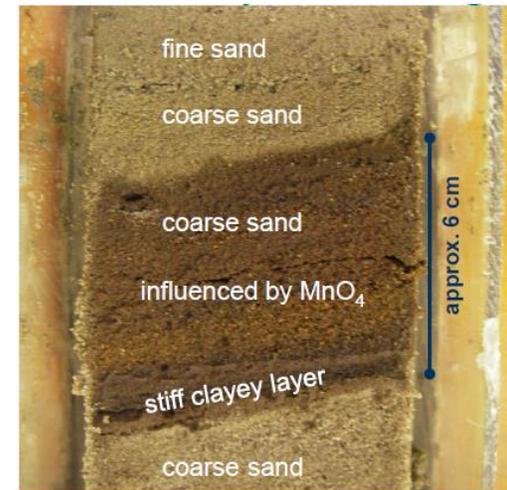

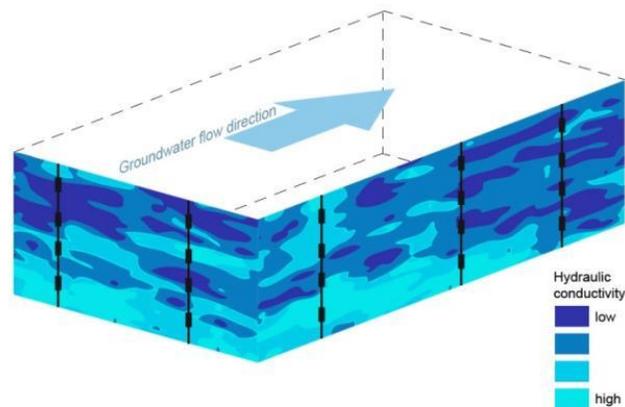

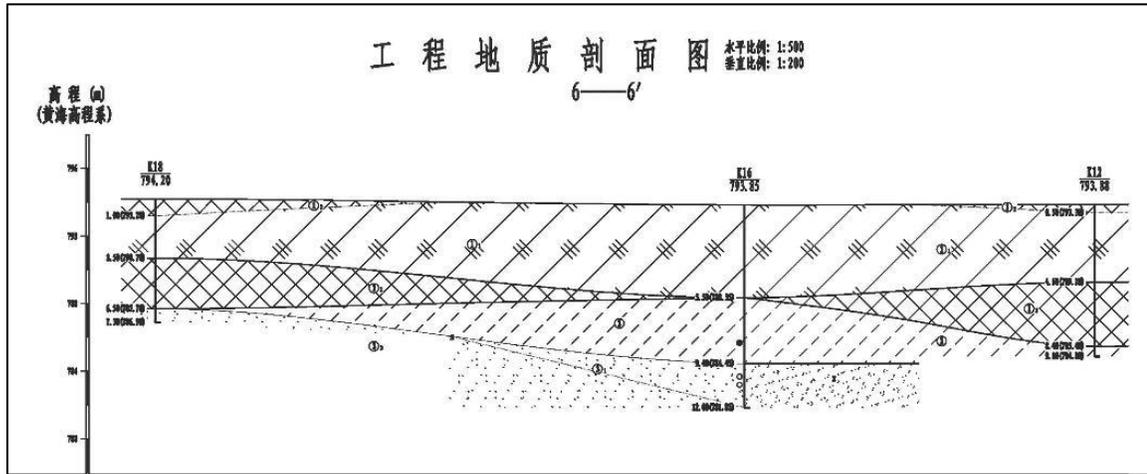

# Where we are

Headquater Location, Gruibingen, Baden Württemberg, Germany

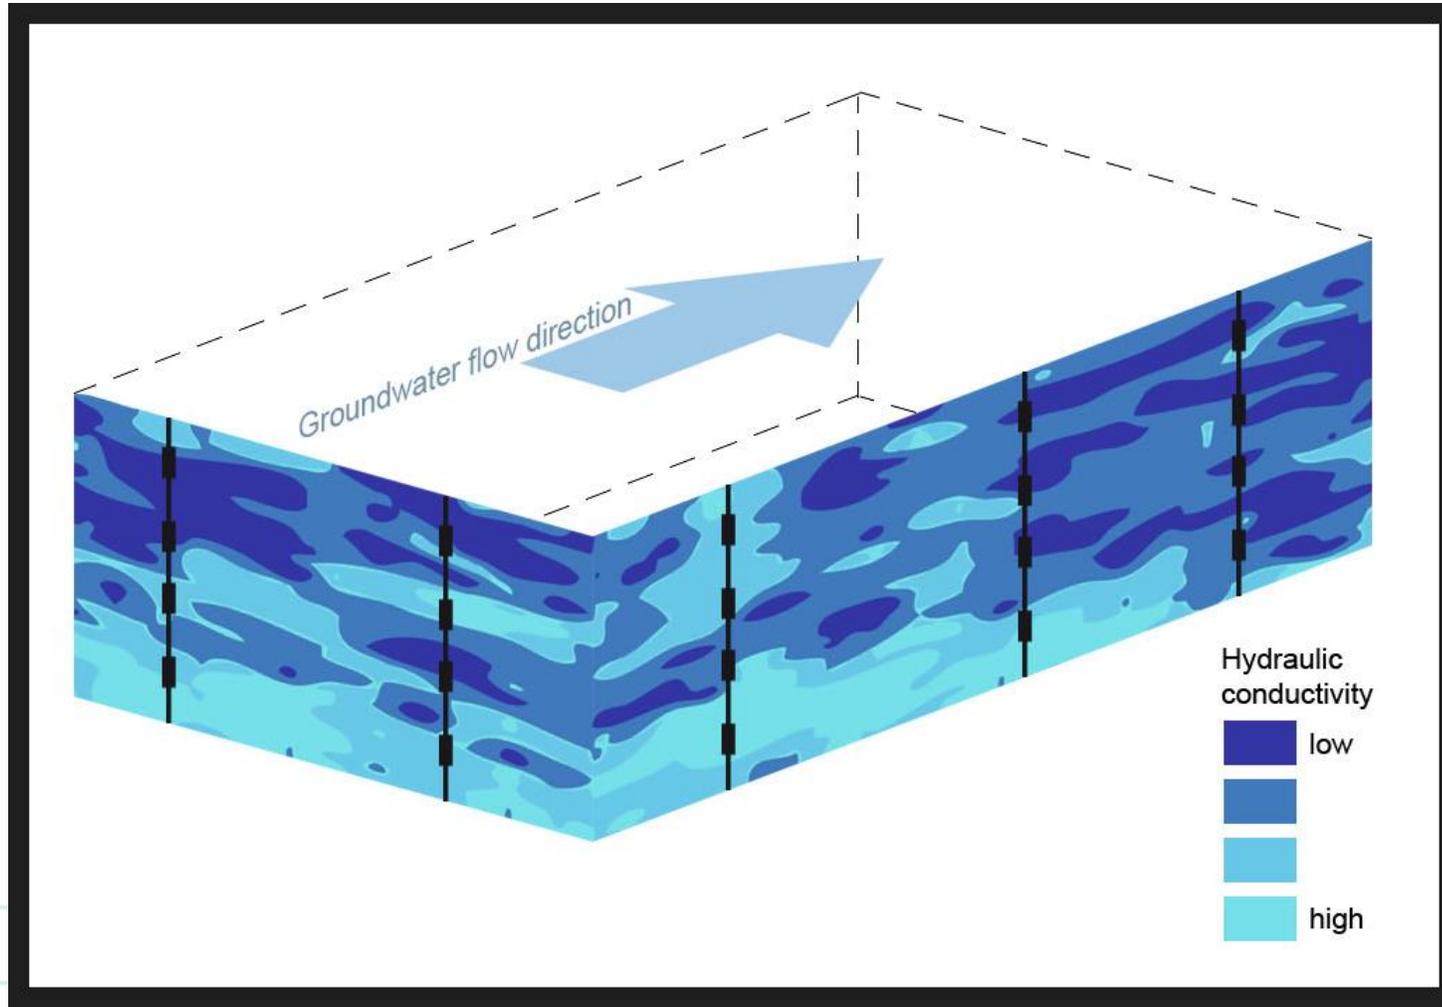

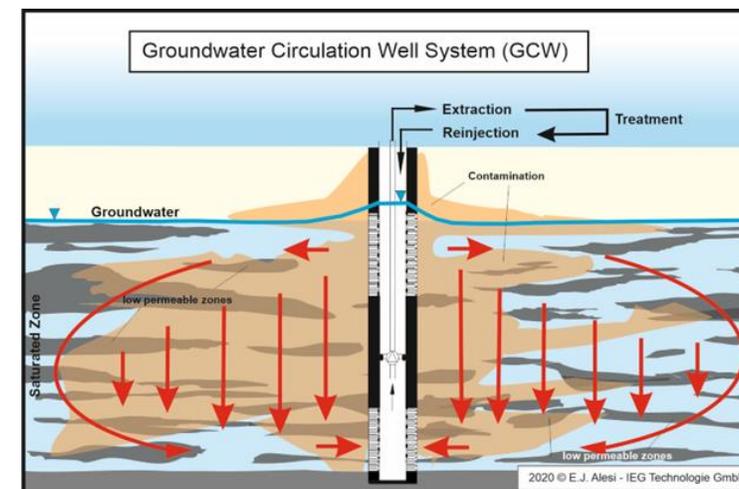

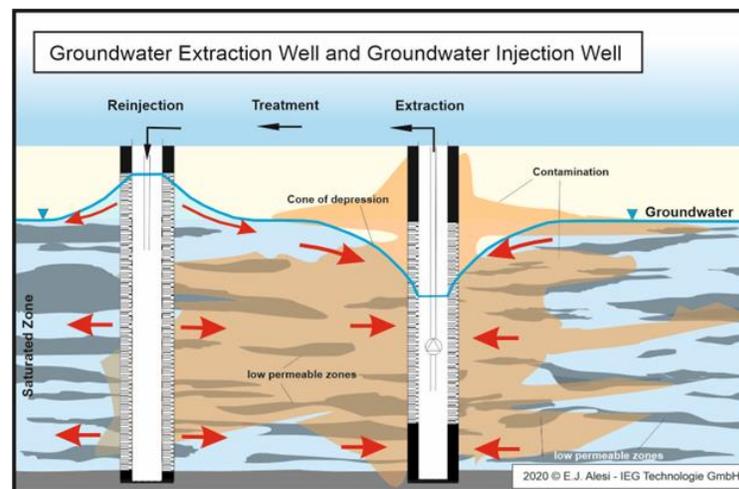

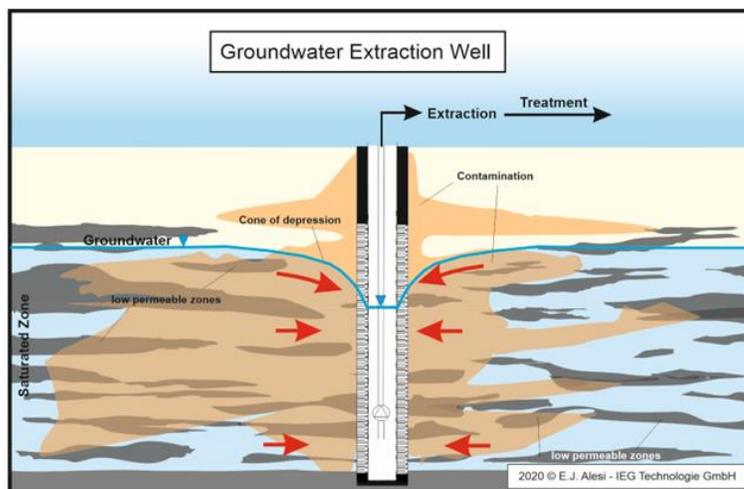

# Why IEG-GCW® ?

## Heterogeneity

# Hetrogeneity !

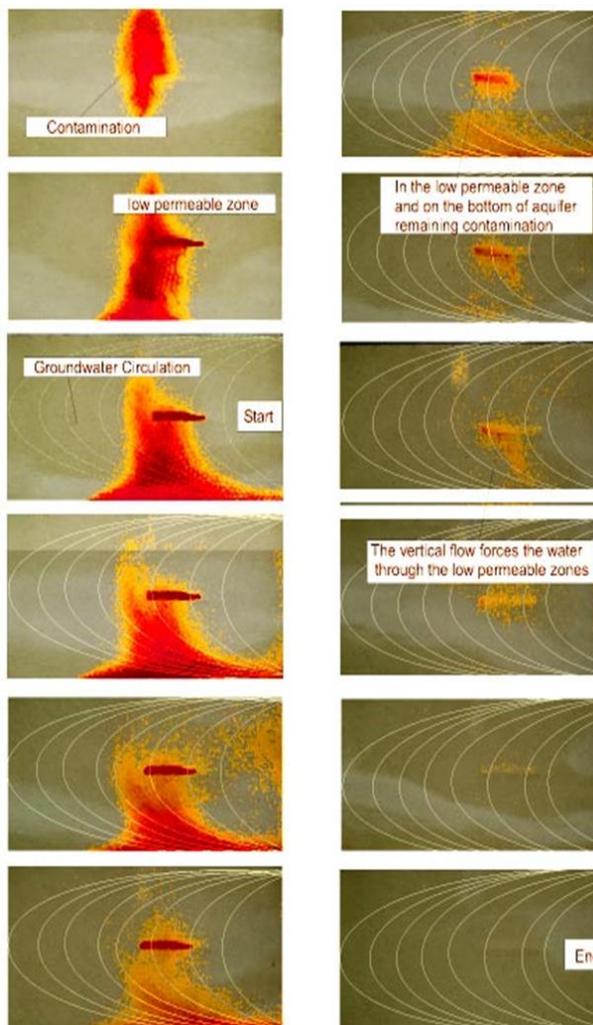

# Comparison Extraction, Extraction & Injection with Groundwater Circulation

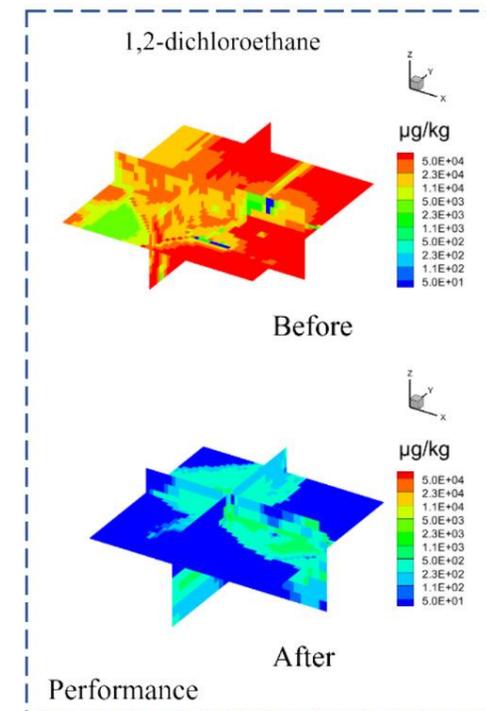

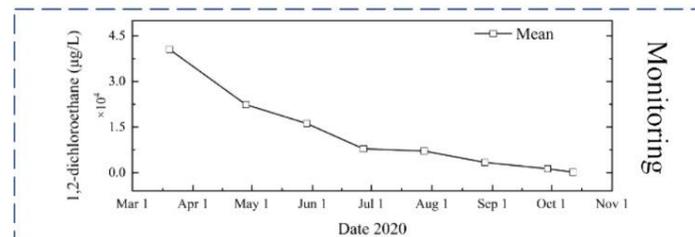

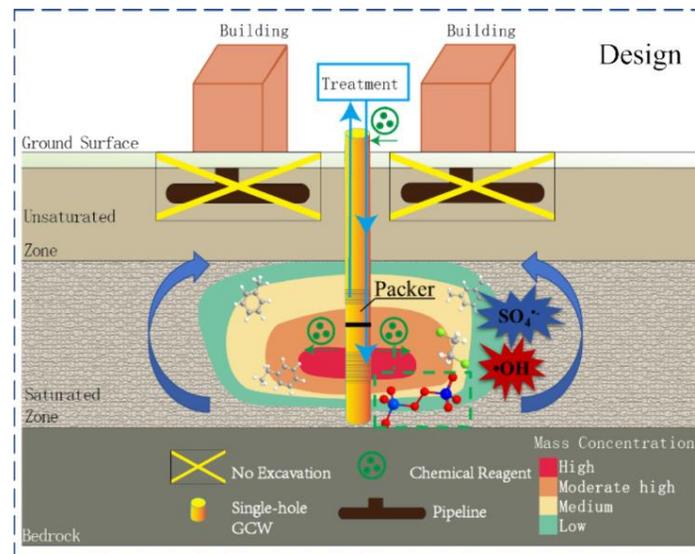

## BENEFITS

- Setup of diverse directed circular flow fields around GCWs for effective mobilization of contaminants, distribution of nutrients, liquid and colloidal supplements
- The hydraulic flushing system can be combined with physical - chemical, microbiological and reactive treatment processes
- Faster remediation time because vertical circulation forces groundwater perpendicular to low permeable zones

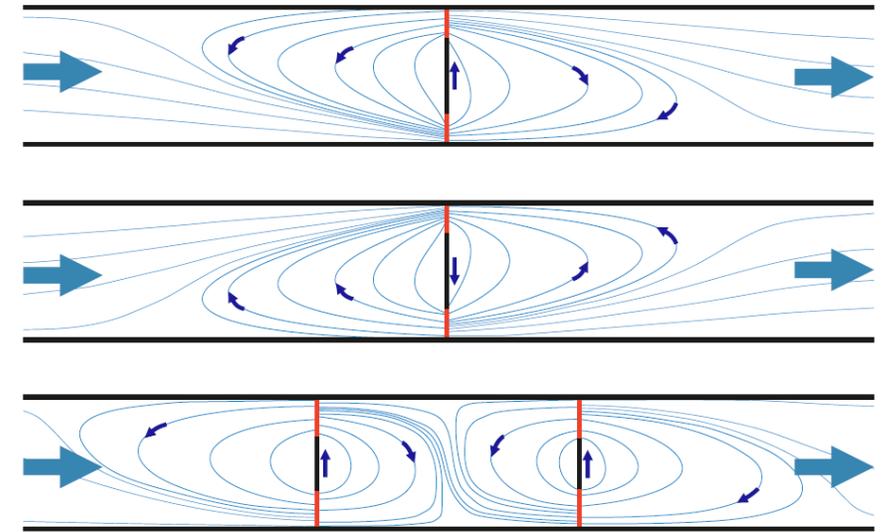

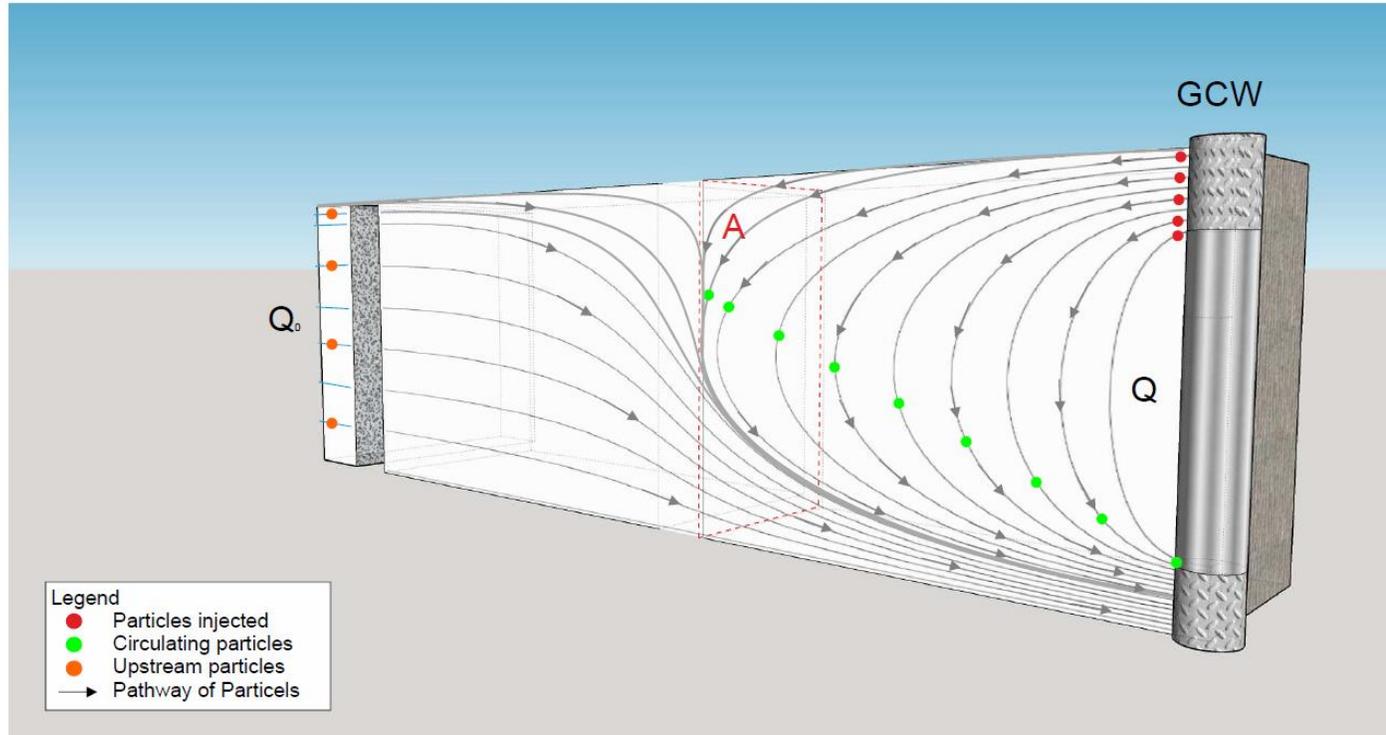

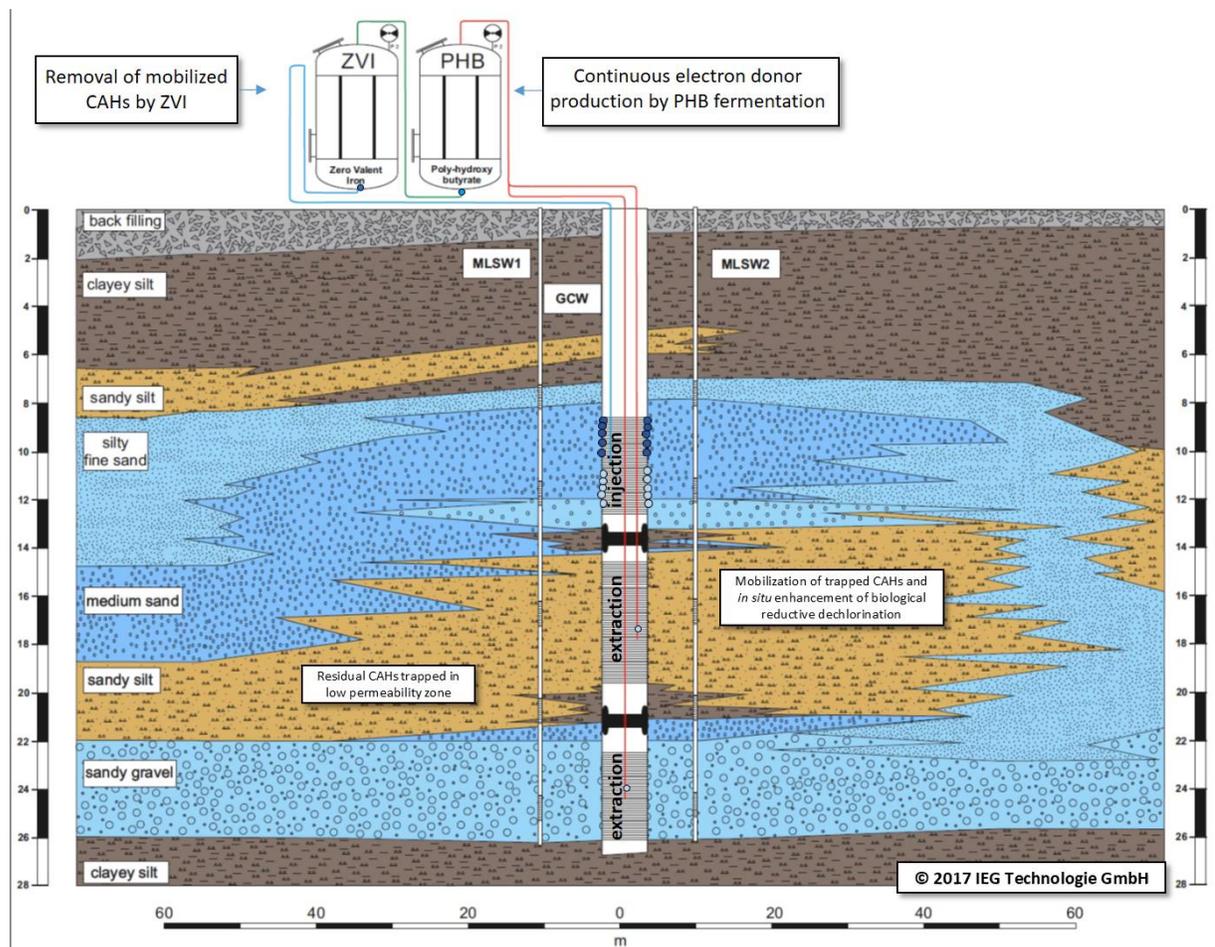

## BENEFITS

- Effective *in situ* treatment without groundwater removal from the subsurface
- Minimally invasive and non-disruptive to site conditions
- Accelerated mass removal to reduce treatment time and accelerate site closure
- Simultaneous treatment of unsaturated zone and capillary fringe

# GCW Principle

# Drilling

## GCW Well Drilling

# Constructing a GCW Remediation Well

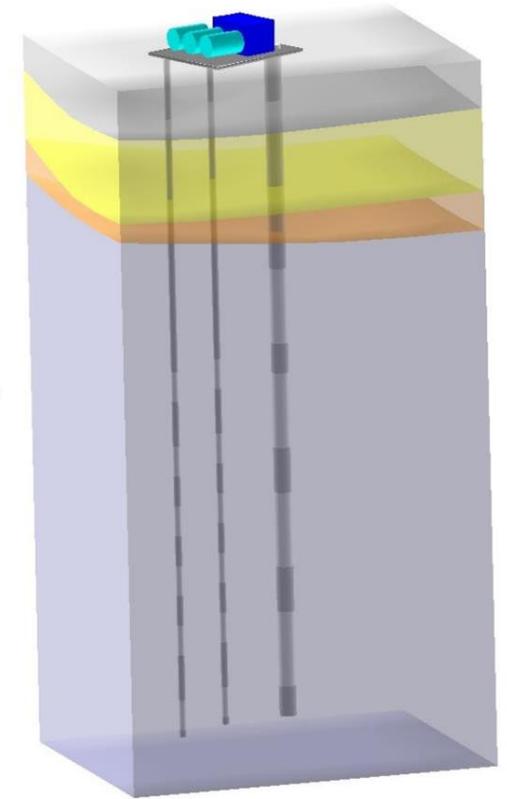

## Stratigraphy

- Riporto
- Conglomerato
- Breccia
- Calcare

## Well Construction

- Pipe
- Screen

Construction and Manufacturing

# Installation

## GCW Well Drilling

# Above Ground Treatment Systems

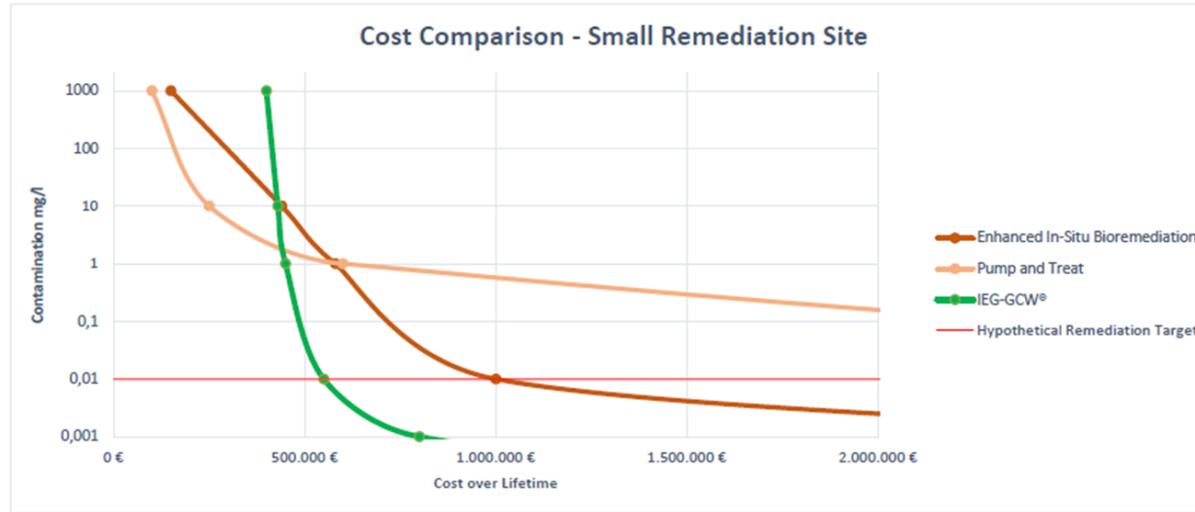

## Groundwater treatment

All kinds of purification techniques (strippers, activated carbon, biofilters, ion exchangers, membrane technique etc.) can be integrated into the groundwater circuit.

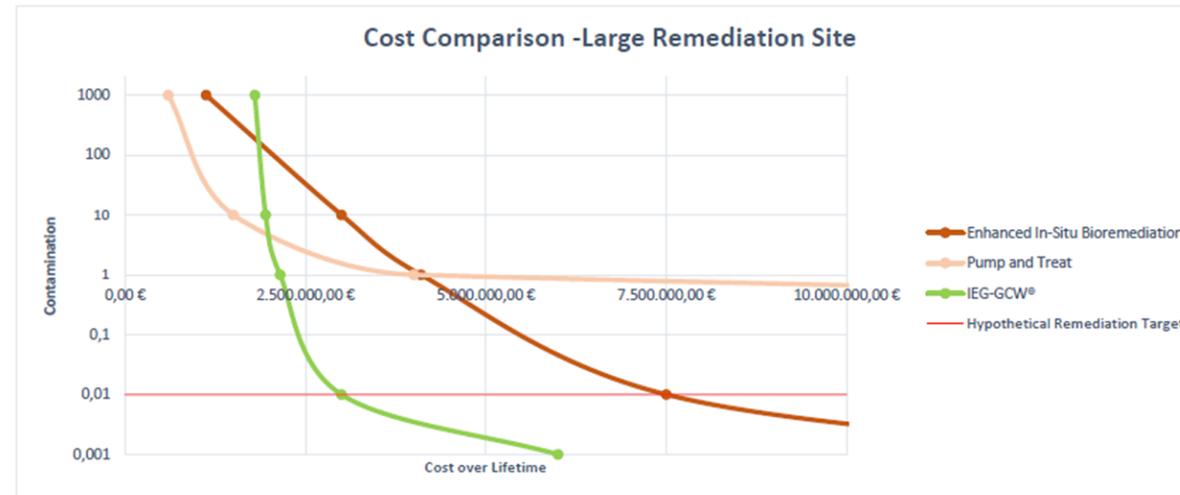

The devices for purifying the polluted groundwater can be installed in the well shaft itself, in a below ground vault or in an above ground placed container. If the circulation flow is used to supply gaseous, liquid or colloidal substances to the water-saturated zone, the aquifer itself becomes the reactor.

# Costs

Small Site: 2500m<sup>2</sup> Groundwater level 10m bgl; Aquifer 10m; Contaminants CVOC; Total volume to be treated 25.000m<sup>3</sup>

Large Site: 50000m<sup>2</sup> Groundwater level 10m bgl; Aquifer 10m; Contaminants CVOC; Total volume to be treated 500.000m<sup>3</sup>
